

AIR CUSHION FILM MADE FROM POTATO STARCH

PlantWave

AirWave's PlantWave air cushion films are 100% compostable in nature. They are made from regrowing resources, including potato starch. The potato starch blend is completely broken down by microbes in the environment and leaves no microplastic.

PlantWave – home compostable

The unique air cushion film is suitable for packaging all products, e.g. cosmetics, pet supplies, medicines, electronic devices, sensitive components, textiles - but also food is best packed in PlantWave. The film thickness is minimal at 0,8mil. The regular perforation allows the air cushions to be easily separated. Last but not least, the cost savings compared to crumbled paper cushioning are amazing.

The disposal is done with organic waste or via compost in the garden - simple, environmentally friendly.

The PlantWave is suitable for the filling of small to large cavities and as an intermediate layer. PlantWave is available as air cushion filler or wrapper.

100% Airwave transport protection with 100% home compostable film.

PlantWave type 7 for void filling and type 8 for wrapping
